

# Google Colab 101

Teeradaj Racharak (เอ็ดดี้)

[r.teeradaj@gmail.com](mailto:r.teeradaj@gmail.com)

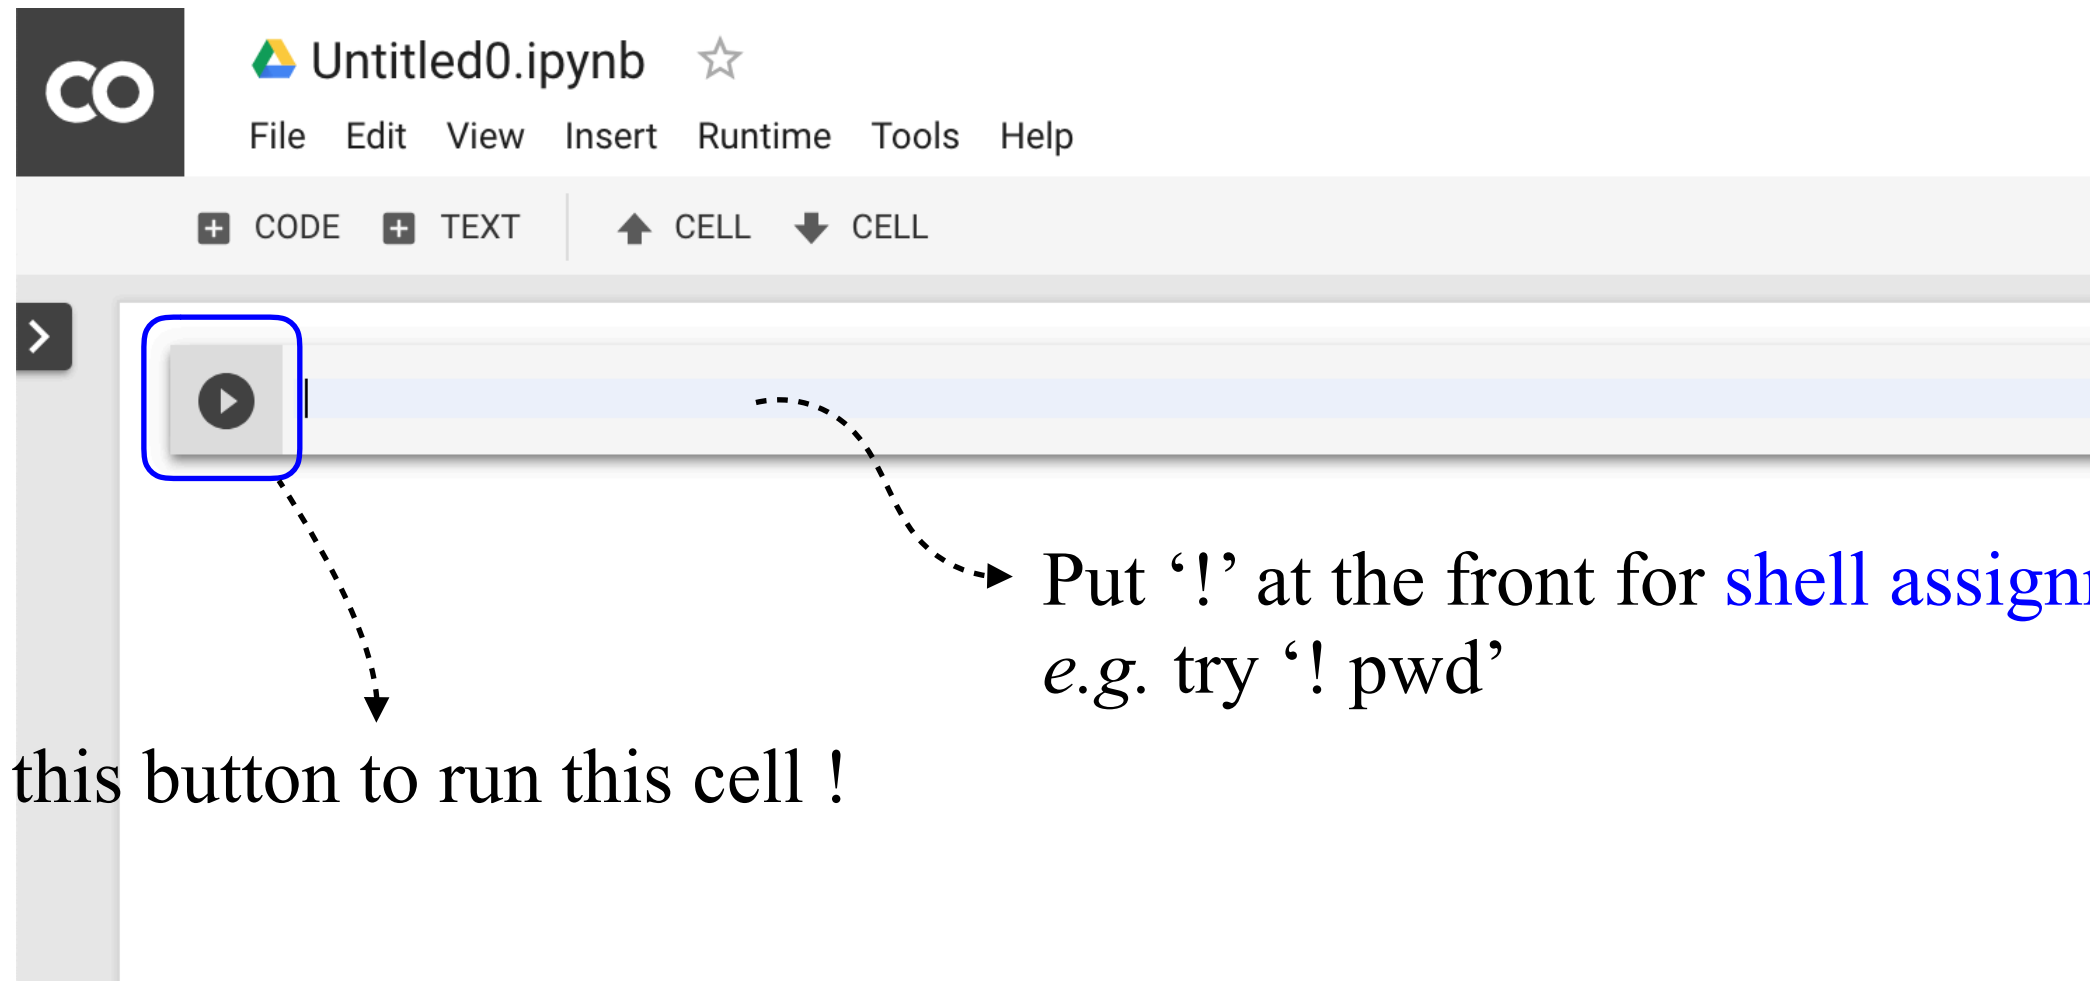

# What is Colab?

- Google Colab is a Jupyter Notebook with free GPU.
  - ▶ <https://colab.research.google.com>
- Good to try deep learning without paying money for expensive GPU on AWS, GCP, or other cloud platforms !

# Things we should know

Press this button to run this cell !

Put '!' at the front for **shell assignment**  
e.g. try '! pwd'

# TensorBoard with Colab

## Idea

To run TensorBoard in the background of Google Colab, use ngrok to tunnel traffic to localhost, so that it can be accessed outside Google Colab. Its detail can be found in this [stackoverflow](#). [Credit to Joope](#)

It may seem complicated ! We have another bypass...

*i.e.* use TensorBoardColab

(<https://github.com/taomanwai/tensorboardcolab>)

```
[ ] !pip install -U tensorboardcolab
```

→ To ensure we are using the latest version

# TensorBoard with Colab

- To initialize TensorBoardColab,

```
 from tensorboardcolab import *  
tensorboard_colab = TensorBoardColab()
```

# TensorBoard with Colab

- To initialize TensorBoardColab,

```
 from tensorboardcolab import *  
tensorboard_colab = TensorBoardColab()
```

- Now, we need to get an instance of FileWriter:

```
colab_writer = tensorboard_colab.get_writer();  
colab_writer.add_graph(session.graph)  
colab_writer.flush();
```

# TensorBoard with Colab

```
colab_writer = tensorboard_colab.get_writer();  
colab_writer.add_graph(session.graph)  
colab_writer.flush();
```

- This is an equivalent way of doing:

```
writer = tf.summary.FileWriter('./graphs/linear_regression', session.graph)
```

- Be careful ! event files will be saved at './Graph' location

# TensorBoard with Colab

- To add a summary in TensorBoard:

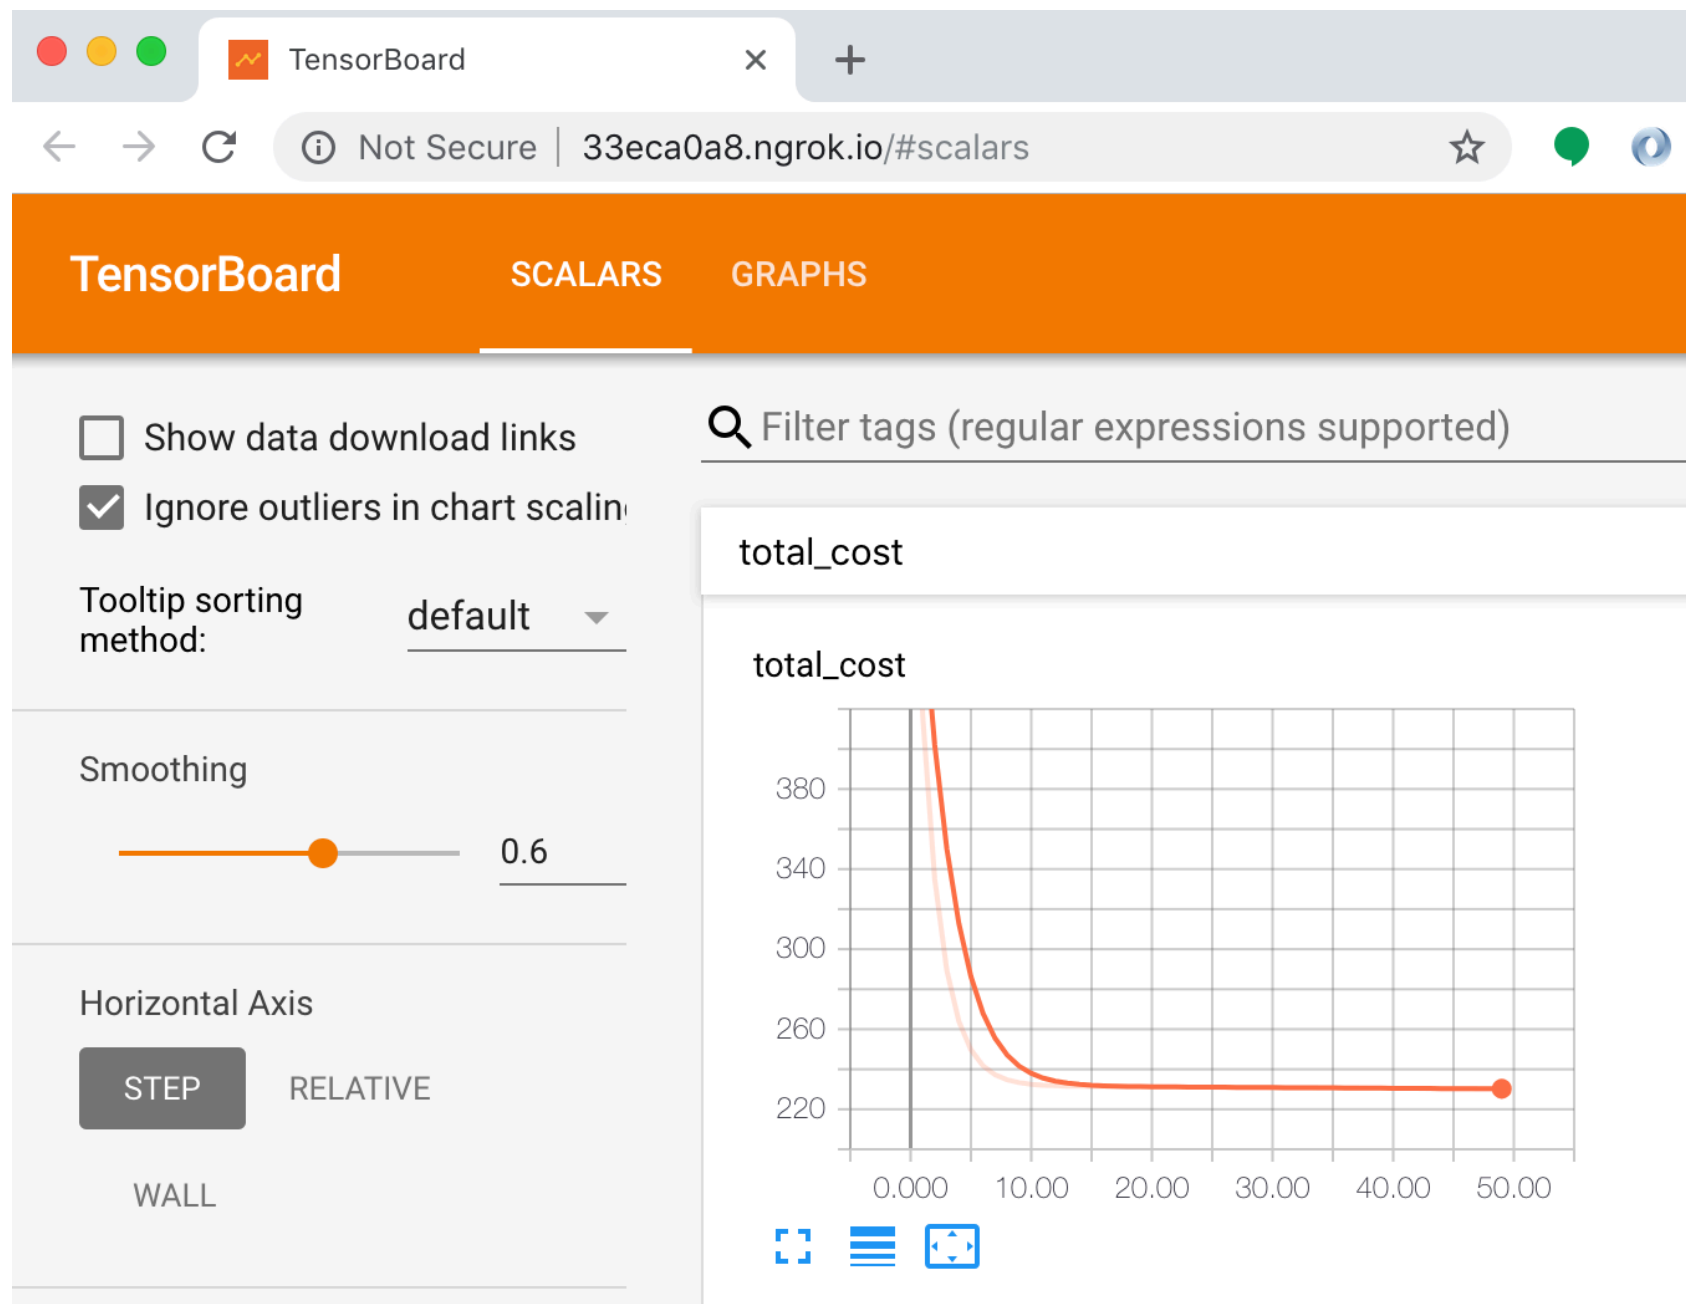

```
summary, cost = session.run([merged, loss_function], feed_dict={X: data.T[0], Y: data.T[1]})  
colab_writer.add_summary(summary, i)  
colab_writer.flush();
```

- This is an equivalent way of doing:

```
summary, cost = session.run([merged, loss_function], feed_dict={X: data.T[0], Y: data.T[1]})  
writer.add_summary(summary, i)
```

# TensorBoard with Colab

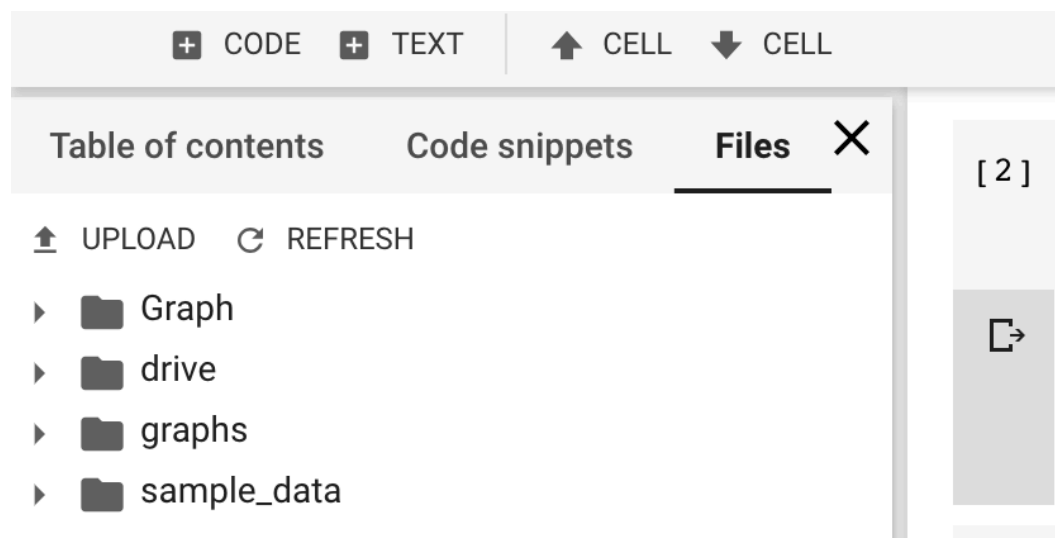

# Connect with Google Drive

1

```
from google.colab import drive
drive.mount('/content/drive')
```

2

- This will prompt for authorization
  - (1) Open the link in a new tab
  - (2) We will get a code
  - (3) Copy the code and put it back to the prompt
  - (4) Now, we have access to Drive !
- Now, you can have fun with it *e.g.*
  - `!cp "/content/drive/My Drive/xy.py" "xy.py"`
  - `!ls`

Hope you enjoy !
